

Get Hired Quicker

OpenAI Build Week Project

By: Dan Anderson

<https://github.com/MillaFleurs>

Retriever

Company-site job intelligence
for job seekers

Codex plugin

Local SQLite

No applications

Find roles early. Track signals locally.

The Idea

- *The Harvard Business Review* did a study showing recruiters preferentially hire from the first resumes they receive. See [“Are You Biased Toward Job Candidates Who Reply Quickly?” by Eric M. VanEpps and Einav Hart](#)
- Job aggregators may show roles that are weeks old, and by then you've already lost the early-applicant edge.
- Ideally you need to check corporate sites daily for new roles.

That's a lot of work. But **fortunately we have Codex**

How it works

- **Retriever is open source and built on Codex.**
- Retriever is a Codex Plug In that sets up a list of companies you'd like to work for, based on geography.
- During set up, Retriever interviews you about what kind of roles you want and what your experience is, to match you with relevant jobs.
- On a Daily basis you get a list of new jobs, so you can be first out the gate.
- Data is stored in a backend database that is queryable via natural language with Codex

You apply to jobs the day
they're posted,
TO GET HIRED QUICKER!

Why Codex?

- We make use of a number of features unique to Codex:
 - Codex has a plug in to interact with Google Chrome. This eliminates web scraper issues common with the competition
 - Codex allows regular scheduling of tasks with an LLM. It'll talk to you and learn based on what you tell it. Data persists in ~/.retriever
 - Codex talks to you like a person, in natural language.

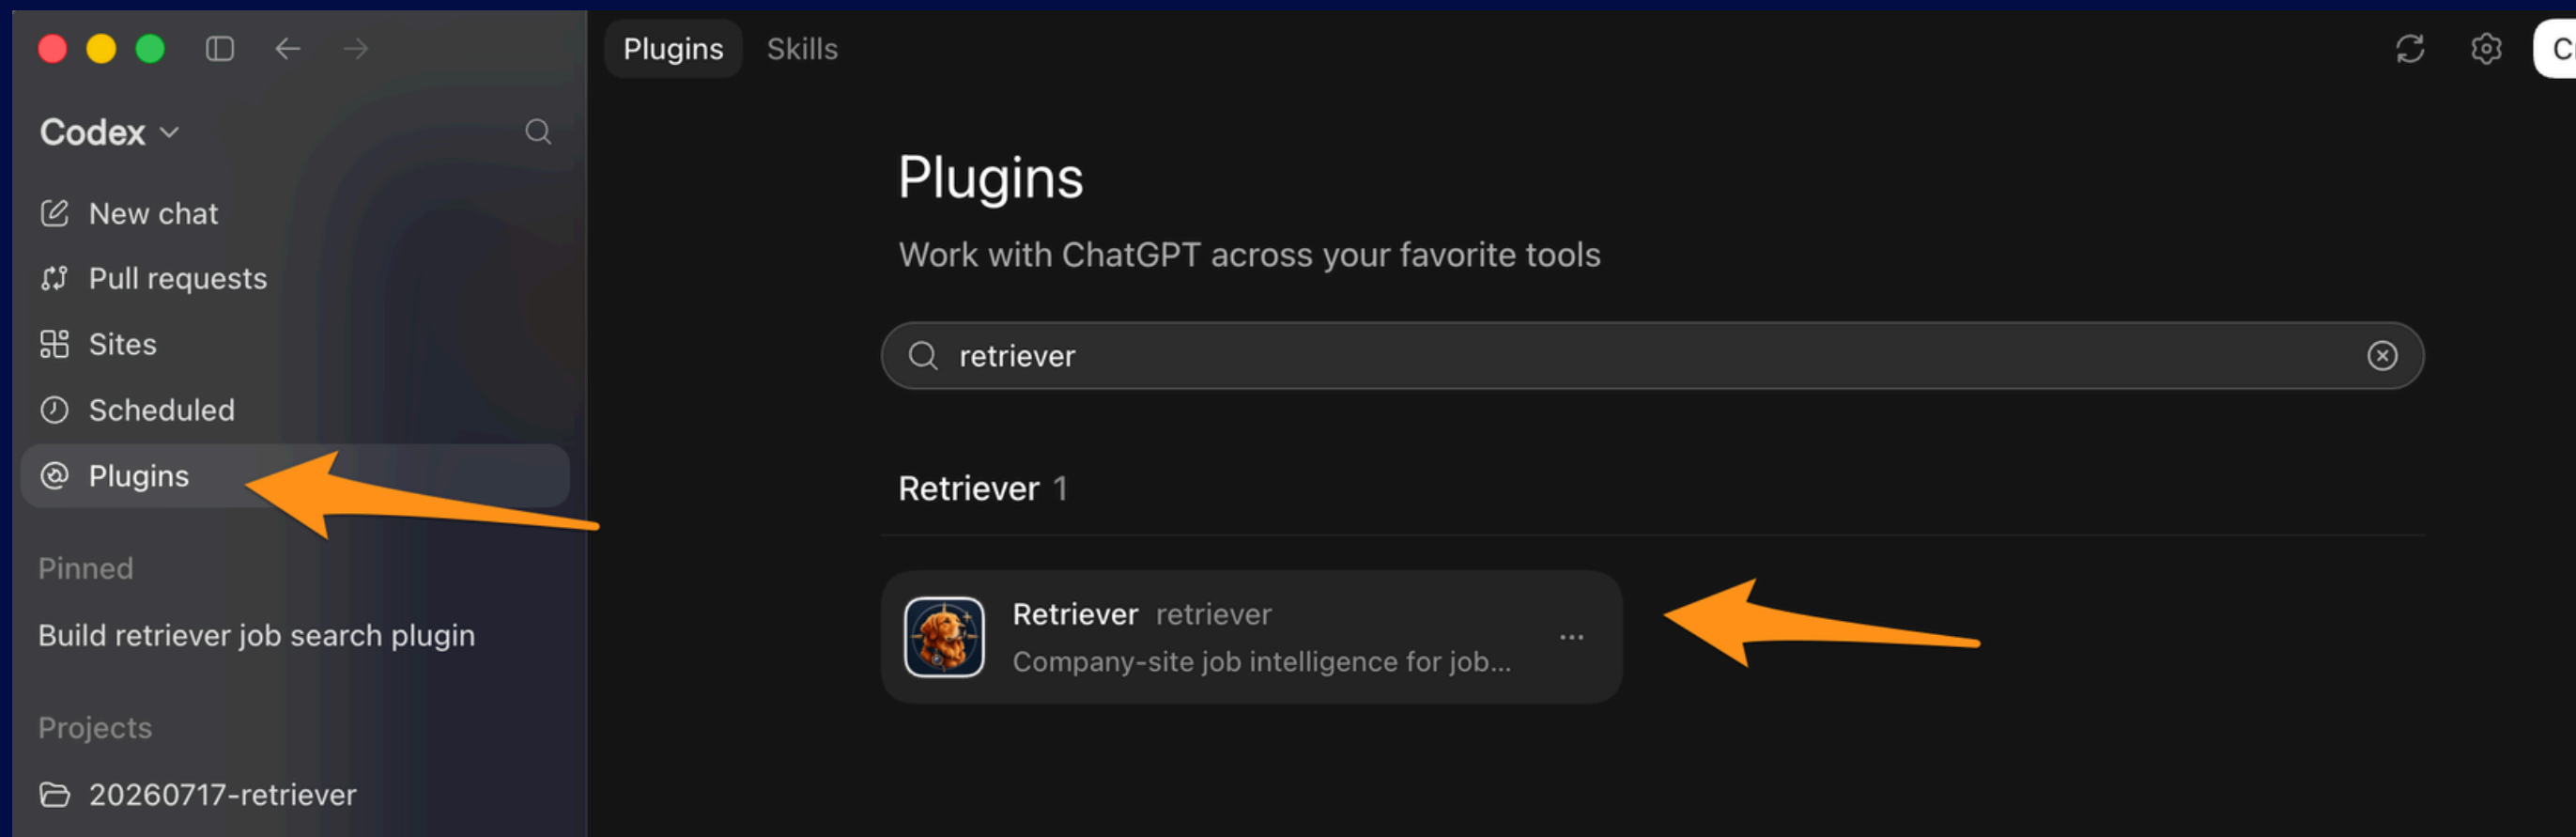

Install from Github on Mac

From a terminal, add Retriever's GitHub marketplace and install the plugin:

```
$ codex plugin marketplace add MillaFleurs/retriever
```

```
$ codex plugin add retriever@retriever
```

You can now install retriever from the Plugins tab:

Install from Github on Mac

From the Plugins page you can install the plug in:

Plugins > Retriever

Retriever

Company-site job intelligence for job seekers.

+ Install plugin

Retriever acts as a scoped career coach and reconnaissance tool for job seekers. It asks for resume and search preferences before creating a local USER.md profile, asks permission before the first Chrome company-site search, stores findings in SQLite under ~/.retriever, warns about prompt-injection content, ranks and exports job reports, and never submits applications.

Skills 6

-  **Retriever Manage**
Update targets, cadence, and archives.
-  **Retriever Onboard**
Build a scheduled local job-search profile.
-  **Retriever Report**
Open and export local job results.

Install from Github on Mac

Once installed, click the try it now button:

Retriever
Company-site job intelligence for job seekers.

Install from Github on Mac

You can have a conversation in plain English with Retriever. Once you tell it your background, and provide it the list of companies you'd like to look for employment at, it'll set up a regular cadence to notify you of new positions at your chosen companies.

Apply first, get hired faster!

Having trouble? ChatGPT and Codex can talk to you and walk you through any issues...

Like my work?

I plan to submit Retriever to OpenAI as a formal plugin, and I'll keep using it daily for my own search.

I hope it helps with yours, too. Maybe we can even help each other: I'm currently looking for Technical Program Manager roles.
